

Fibonacci and Golden Ratio Formulae

Here are almost 300 formula involving the Fibonacci numbers and the golden ratio together with the Lucas numbers and the General Fibonacci series (the G series). This forms a major reference page for Ron Knott's [Fibonacci Web site](http://www.maths.surrey.ac.uk/hosted-sites/R.Knott/Fibonacci/fib.html) (<http://www.maths.surrey.ac.uk/hosted-sites/R.Knott/Fibonacci/fib.html>) where there are many more details and explanations with applications, puzzles and investigations aimed at secondary school students and teachers as well as interested mathematical enthusiasts.

Note that it is **easy to search for a named formula** on this page since it is an HTML page and the formulae are not images. In your browser main menu, under the **Edit** menu look for **Find...** and type Vajda-N or Dunlap-N for the relevant formula. [Full references](#) are at the foot of this document.

1 Definitions and Notation

Beware of different golden ratio symbols used by different authors!

Where a formula below (or a simple re-arrangement of it) occurs in either Vajda or Dunlap's book, the reference number they use is given here. Dunlap's formulae are listed in his Appendix A3. Hoggatt's formulae are from his "Fibonacci and Lucas Numbers" booklet. Full bibliographic details are at the end of this page in the [References](#) section.

7 Fibonomial formulae

The **Fibonomials** are defined using Fibonacci numbers instead of integers in binomial coefficients and Fibonacci factorials instead of normal factorials. There are many analogous results to those using binomial coefficients but using Fibonomials instead.

We define $F!(n) = F(n)F(n-1)\dots F(2)F(1)$, $n > 0$; $F!(0) = 1$ for which some authors use $n!_F$, to compare with $n! = n(n-1)\dots 3.2.1$.

There is no universal notation for the Fibonomial. The fibonomial "Fibonacci n choose k" is defined as:

$$\binom{n}{k}_F = \frac{F!(n)}{F!(k)F!(n-k)} = \frac{F(n)F(n-1)\dots F(n-k+1)F(n-k)F(n-k-1)\dots F(2)F(1)}{F(k)F(k-1)\dots F(2)F(1)F(n-k)F(n-k-1)\dots F(2)F(1)} \quad \text{if } n \geq k \geq 0$$

$$= 0, \text{ otherwise}$$

$$\binom{n}{k}$$

Vajda (page 74) uses $J(n,k)$. D Knuth and others use double brackets:

$$\left[\begin{matrix} n \\ k \end{matrix} \right]$$

others use square brackets:

A simple alternative is to write $\text{fibonomial}(n,k)$.

Here is a table of some values of the fibonomial ([A010048](#))

n	k	0	1	2	3	4	5	6	7

8 G Formulae

G(i) is the General Fibonacci series. It has the same recurrence relation as Fibonacci and Lucas, namely **G(n+2) = G(n+1) + G(n)** for all integers n (i.e. n can be negative) Vajda-3, Dunlap 4, but the "starting values" of G(0)=a and G(1)=b can be specified. To make it clear which starting values for G(0)=a and G(1)=b are being used, we write G(a,b,i) for G(i). G(n) is an abbreviation for G(a,b,n) when a and b are understood from the context.

Special cases are the Fibonacci and Lucas series since F(n) = G(0,1,n) and L(n)=G(2,1,n):

- If G(0)=0 and G(1)=1 we have 0,1,1,2,3,5,8,13,... the Fibonacci series, i.e. G(0,1,n) = F(n);
- G(0)=2 and G(1)=1 gives 2,1,3,4,7,11,18,... the Lucas series, i.e. G(2,1,n) = L(n);

8.1 Basic G Formulae

Two independent G series are here denoted G(n) and H(n), i.e. G(0) and G(1) are independent of H(0) and H(1).

8.2 G Formulae of Order 2 or more

These formulae include terms which are a product of two G numbers either from the same G series or from two different G series i.e. with different index 0 and 1 values. Where the series may be different they are denoted G and H e.g. special cases include G = F (i.e. Fibonacci) and H = L (i.e. Lucas), or they could also be the same series G=H.

9.2 Decimal (and other bases) fractions

We saw in [The Fibonacci Series as a Decimal Fraction](#) that the Fibonacci series occurs naturally as the decimal expansion of a simple fraction in several ways:

$$\begin{aligned} 1/89 &= 0.0\ 1\ 1\ 2\ 3\ 5\ ... \\ 1/9899 &= 0.00\ 01\ 01\ 02\ 03\ 05\ 08\ 13\ 21\ ... \end{aligned}$$

with a varying number of decimal digits before the Fibonacci numbers overlap and the series is obscured. This section gives formulae for these fractions for various subsequences of Fibonacci and General Fibonacci series.

$$\sum_{k=1}^{\infty} 10^{-n(k+1)} F(ak) = \frac{F(a)}{10^{2n} - 10^n L(a) - (-1)^n} \quad \text{Hudson and Winans (1981)}$$

If $P(n) = a P(n-1) + b P(n-2)$ for $n \geq 2$; $P(0) = c$; $P(1) = d$ and m and N are defined by $B^2 = m + Ba + b$, $N = cm + dB + bc$, then

B&Q (2003) [Proofs That Really Count](#) A T Benjamin, J J Quinn, Mathematical Association of America, 2003, ISBN 0-88385-333-7, hardback, 194 pages.

Art Benjamin and Jennifer Quinn have a wonderful knack of presenting proofs that involve counting arrangements of dominoes and tiling patterns in two ways that convince you that a formula really *is* true and not just "proved"! The identities proved mainly involve Fibonacci, Lucas and the General Fibonacci series with chapters on continued fractions, binomial identities, the Harmonic and Stirling numbers too. There is so much here to inspire students to find proofs for themselves and to show that proofs can be fun too!

Important notation difference: Benjamin and Quinn use f_n for the Fibonacci number $F(n+1)$

L E Dickson [History of the Theory of Numbers: Vol 1 Divisibility and Primality](#)

is a classic and monumental reference work on all aspects of Number Theory in 3 volumes (volume II is on Diophantine Analysis and volume III on Quadratic and Higher Forms). Although not up-to-date (the original edition was 1952) it is still a comprehensive summary of useful historical and early references on all aspects of Number Theory. The link is to a new cheap Dover paperback edition (2005) of Volume 1 which contains the most about Fibonacci Numbers, Lucas numbers and the golden section: see Chapter XVII on **Recurring Series, Lucas' u_n , v_n** where he uses *the series of Pisano* for what we now call the *Fibonacci numbers*.

Dunlap (1997), [The Golden Ratio and Fibonacci Numbers](#) R A Dunlap, World Scientific Press, 1997, 162 pages.

An introductory book strong on the geometry and natural aspects of the golden section but it does not include much on the mathematical detail. Beware - some of the formulae in the Appendix are wrong! Dunlap has copied them from Vajda's book (see below) and he has faithfully preserved all of the original errors! The formulae on this page (that you are now reading) are corrected versions and have been verified.

No - this is not a book about proportions of sand to cement 😊. The title is meant as an antidote to the "Abstract Mathematics" courses so often found in the curriculum of a university maths degree. As such, it is **the** book to dip into if you want to go really deeply into any part of the mathematics covered on this Fibonacci and Phi site. However, it quickly gets to an advanced mathematics undergraduate level after some nice introductions to every topic.

There are notes left in the margins which were inserted by students taking the original courses based on this book at Stanford university and they are interesting, often useful and sometimes quite funny.

on the power of matrix methods to establish many Fibonacci formula with ease (but it does rely on at least undergraduate level matrix mathematics). See the **Matrix methods for Fibonacci and Related Sequences** link to a Postscript and PDF version on his [Fibonacci Resources](#) web page.

This book is packed full of an amazing number of Fibonacci and related equations, mostly culled from the pages of the *Fibonacci Quarterly*. Although initially impressive in its size and breadth, be aware that

there are far too many typos, errors and missing or irrelevant conditions in many of its formulae as well as some glaring omissions and misattributions particularly with respect to the original references for a number of the formulae. Although Fibonacci representations of integers are included Zeckendorf himself is never even mentioned! There are lots of exercises with answers to the odd-numbered questions.

This is a wonderful book, a classic, originally published in 1989 and now back in print in this Dover edition. This book is full of formulae on the Fibonacci numbers and Phi and the Lucas numbers. The whole book develops the formulae step by step, proving each from earlier ones or occasionally from scratch. It has a few errors in its formulae and all of them have been dutifully and exactly copied by authors such as Dunlap (see above) and others! Where I have identified errors, **they have been corrected here on this page**.
